Press Release 5-2011

Climate Change Book *Cold Sun* Predicting Dangerous Cold Climate, Receives Worldwide Praise

Monday, June 6, 2011 8:30 am

The Space and Science Research Corporation (SSRC) announces today the publication of a compelling new book on climate change. *Cold Sun*, authored by SSRC President, John L. Casey has been three years in the making and has already achieved worldwide acclaim from scientists and other experts.

A former White House space program policy advisor, NASA Headquarters consultant, and space shuttle engineer, Mr. Casey comments on the acceptance of his book by prominent scientists by saying, "I am truly humbled by the endorsements extended to this book by so many respected researchers. Some of them have spent their entire careers studying the Sun and its impacts on the Earth, including its climate, earthquakes and volcanic activity. For too long now the general public has not been told the full story about the natural causes of climate change. Hopefully this book will provide them with the information necessary to understand climate change better and most importantly, prepare for what is coming."

Relying heavily on the research of experts globally, as well as his own original research that correctly predicted the change in the Sun's behavior, Mr. Casey has spelled out a convincing case that a new cold era has arrived. In *Cold Sun*, Mr. Casey presents the evidence showing:

1. Global warming ended years ago.
2. The Sun has entered an ominous state of 'hibernation.'
3. The Earth's ocean and atmospheric temperatures are dropping rapidly and are now on a long term decline for the next thirty years.
4. Glacial ice worldwide is growing again and the threat of rising sea levels is over.
5. Why we should be preparing now for the coming cold and its ill-effects including record earthquakes, and volcanic eruptions as well as global agricultural devastation.

Here is a sampling of some of the praise *Cold Sun* is receiving from experts around the world:

From Japan, Dr. Fumio Tsunoda - "The air is filled with lectures and rumors that our Earth is getting warm. The author of *Cold Sun*, John Casey has found evidence to the contrary. His work is quite a revelation that marks a step toward a new scientific civilization. This book adds a brilliant page to the history of science!"

From Australia, Dr. Dong Choi - "This is an Earth-shattering book! ...The Sun has surely entered the hibernation stage and we are going to have challenging decades ahead."

From Bulgaria, Dr. Boris Komitov - "These problems brought on by this next climate change that Casey ably discusses in *Cold Sun*, are more important than ever before. We are facing once again food and energy shortages with a population close to 7 billion...For these reasons I recommend the book *Cold Sun* as being both timely and necessary."

From Norway, Dr. Ole Humlum – "This book represents a fascinating read and the potential consequences outlined are no less than far ranging."

From India, Dr. Natarajan Venkatanathan - "*Cold Sun* is simply a great work! It throws new light into the climatic patterns of the Earth.

From Italy, Dr. Giovanni Gregori – "John Casey approaches problems like a true scientist, who follows Leonardo da Vinci, and he also knows how to explain concepts in a form that anyone can understand....John Casey stands against conventional climate change dogma and gives us an important and objective view of why the Earth's climate varies."

From the US, Dr. Rich Swier - "John Casey is both an expert and visionary on the causes and effects of global climate change. His seminal work *Cold Sun* connects the dots and proves that our national policies and scientific community have gotten it very wrong. *Cold Sun* is a must read for government leaders at every level and all Americans."

From the US, Carole Hemingway – "Cold Sun is a spellbinding look into our future; dark sweeping, and written with grace and eloquence...Casey is remarkable!

The book, *Cold Sun* is available through Trafford Publishing in hard cover and paperback at www.trafford.com and will soon be available from several sources in an eBook format for download to many portable reading devices. The SSRC has established a separate web site at www.coldsun.net/ with more details and excerpts from *Cold Sun*, how to obtain the book, and the complete endorsement statements from these prominent experts.

The Space and Science Research Corporation, (SSRC), in Orlando, Florida has been conducting important research since 2008 into the effects upon the Earth's climate changes and related frequency and intensity of earthquakes and volcanic eruptions brought on during dramatic reductions in the Sun's energy output. Studies of these 'solar hibernations' by the SSRC has made it possible for the SSRC to make highly accurate climate change and major geophysical event predictions in advance of their occurrence. The SSRC is the leading organization in the US advocating national and global preparedness for the coming cold era.
